

1

ABSTRACT

2        The instant invention involves the use of a combination  
3        of preparatory steps in conjunction with mass spectroscopy  
4        and time-of-flight detection procedures to maximize the  
5        diversity of biopolymers which are verifiable within a  
6        particular sample. The cohort of biopolymers verified within  
7        such a sample is then viewed with reference to their ability  
8        to evidence at least one particular disease state; thereby  
9        enabling a diagnostician to gain the ability to characterize  
10       either the presence or absence of said at least one disease  
11       state relative to recognition of the presence and/or the  
12       absence of said biopolymer.
